Sequence 1, Application US/08484594A
Patent No. 5714459
GENERAL INFORMATION:
APPLICANT: O'Brien, John S.
APPLICANT: Klahimoto, Yasuo
TITLE OF INVENTION: USE OF PROSAPOSIN AND NEUROTROPHIC PEPTIDES
TITLE OF INVENTION: DERIVED THEREFROM
NUMBER OF SEQUENCES: 11
CORRESPONDENCE ADDRESS:
ADDRESSE: Knobbe, Martens, Olson and Bear
STREET: 620 Newport Center Drive, Sixteenth Floor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                        human saposin-C (AAR70784), promotes heurite outgrowth in vitro.
A consensus sequence was determined by comparing the peptide with hematopoietic and neuropoietic cytokines, and neurotrophic peptides (AAR70774-82) were identified in the AB loop of human ciliary neurotrophic factor, interleukins-6, -2, -3 and -gamma, erythropoietin and leukocyte inhibitory factor, and in helix C of human interleukin-1-beta and oncostatin-M. Prosaponin (AAR70783) and saposin-C also promoted nerve cell myelination ex vivo.
                                               The peptide given in AAR70773, corresponding to amino acids 8-29 of

control derived proline residues. Prosaposin, saposin C and procaposin derived proline residues. Prosaposin, can define the promoting recovery after toxic, traumatic, myocardial isohraemic, degenerative and inherited lesions to the peripheral and central nervous system. Prosaposin receptor agonists (PRAs) central nervous system. Prosaposin receptor applicates of BC1-2 cambers which inhibit caspases, thereby inhibiting apoptosis. An activation of JNK, a proapoptotic signaling component. Within activation of JNK, a proapoptotic signaling component. Within activation of JNK a proapoptotic signaling component. Within activation of JNK a proapoptotic signaling component. Within activation of JNK by TNF alpha is another well known mechanism for activation of JNK by TNF alpha is another well known mechanism for activation of JNK by TNF alpha is another vell known mechanism for activation of JNK by TNF alpha is another vell known mechanism for caspase-mediated or induced by a proinflammatory cytokine-induced apoptosis. The method can be used for inhibiting apoptosis which is caspase-mediated with a disorder such as e.g. rheumatoid attitions. Sidesase, irritable bowel syndrome, asthma, cardiac infarction, congestive heart failure, multiple sclerosis, acute leavened palaters, acute method inflammatory leuvenecephalitis, progressive multifocal method parters amount many content munitarial method inflammatory luminations at many processive multifocal contents amount of a parters of an unitariant multiple sclerosis, acute method amonic unitariant method sease, and a parter of a parter of a menor of a parter of a

degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial
                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                    co-factor for the lysosomal enzyme glucocerebrosidase, GCB. GCB is the enzyme involved in Gaucher's disease, a lysosomal storage disease. The invention relates to introducing new glycosylation sites into lysosomal enzymes/activators like GCB to improve their bloactivity. The novel polypeptides are used for the prevention and treatment of Gaucher's disease, Farber's disease, G_m_l gangliosidosis, Tay-Saoh's disease, Niemann-Pick disease, Shindler disease, Hunter syndrome, Sly syndrome, Hurler and Huler/Scheie
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GM2 activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing a

A consensus sequence was determined by comparing the peptide with hematopoletic and neuropoletic cytokines, and neurotrophic peptides (AAR70774-82) were identified in the AB loop of human ciliary neurotrophic factor, interleukins-6, -2, -3 and -gamma, erythropoletin and leukocyte inhibitory factor, and in helix C of human interleukin-1-beta and oncostatin-M. Prosaponin (AAR70783) and saposin-C also promoted nerve cell myelination ex vivo.

Prosaposin, saposin C and prosaposin derived peptides (prosaptides), have therapeutic and conserved proline recovery after toxic, traumatic, myocardial ishchaemic, degenerative and inherited lessions to the peripheral and central nervous system. Prosaposin receptor agonists (PRAs) inhibit proinflammatory cytokine-induced apoptosis by activation of the Ser/Arm protein kinase Akt. Akt dissociates complexes of Bcl-2 family members, such as BAD-Bcl-2, releasing Bcl-2 and its family members, such as BAD-Bcl-2, releasing Bcl-2 and its family members which inhibit caspases, thereby inhibiting apoptosis. An additional mechanism whereby PRAs inhibit apoptosis is by blocking activation of JNK, a proapoptotic signaling component. Within several minutes after binding to the receptor, PRAs block JNK activation induced by tumor necrosis factor-alpha (TNF alpha). The activation of JNK by TNF alpha is another well known mechanism for TNF alpha-induced, as well as other proinflammatory cytokine-induced apoptosis. The method can be used for inhibiting apoptosis which is
                                                                                                                                                                                                                                                                                                        irritable bowel syndrome; asthma; cardiac infarction; congestive heart failure; multiple sclerosis; acute disseminated inflammatory leukoencephalitis; acute disseminated inflammatory leukoencephalitis; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; Huntington's disease; isohemic heart disease; Guillain-Barre disease; alopecia; AIDS dementia; cerebral malaria; HTLV; neuropathy; inflammatory neurodegenerative disease; toxin-induced liver disease.

caspase-mediated or induced by a proinflammatory cytokine, for example TNF alpha or interferon-gamma. It can be used for inhibiting apoptosis associated with a disorder such as e.g. rhematoid arthritis, Crohn's disease, irritable bowel syndrome, asthma, cardiac infarction, congestive heart failure, multiple sclerosis, acute disseminated inflammatory leukoencephalitis, progressive multifocal leukoencephalitis, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, Huntington's disease, ischemic heart disease, Guillain-Barre disease, traumatic brain injury, traumatic spinal cord injury, alopecia, AIDS dementia, cerebral malaria, HILV, neuropathy, inflammatory neurodegenerative disease, and toxin-induced liver disease. This 524 N-terminal peptide of prosaposin also acts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

ö
              antiproliferative and antimigratory activity against endothelial cells. This activity is conserved in cryptic polypeptides as small as 5 amino acids (see AAY58684-715), which can be synthetically prepared and used in vitro or in vivo for the treatment of undesired angiogenesis and tumor growth, especially Raposi's sarcoma (claimed). The polypeptides can also be used in conjunction with cytocoxic moleties to selectively kill certain cell types, e.g. for treatment of cancer, anglofibroma, neovascular glaucoma, arteriovenous malformation, nonunion fracture, arthritis and other connective tissue disorders, Osler-Weber syndrome, atherosclerotic plaque, psoriasis, corneal graft neovascularization pyogenic granuloma, retroiental fibroplasia, diabetic retinopathy, scleroderma, haemangloma, trachoma, vascular adhesions and hypertropic scars.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; perlecan; retinol-binding plasma protein; calgranulin B; vaccine; ganglioside GMZ activator; saposin B; degenerative disease; glial cell; neurological disease; auto-immune disease; multiple sclerosis; toxicity; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; rheumatoid polyarthritis; lupus erythematosus; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-blinding plasma protein, precursor of the families. The method is used for detecting, preventing or treating a families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis,

The peptide given in AAR70784, corresponding to amino acids 8-29 of human saposin-C (AAR70784), promotes neurite outgrowth in vitro. A consensus sequence was determined by comparing the peptide with hematopoietic and neuropoietic sytokines, and neurotrophic peptides (AAR70774-82) were identified in the AB loop of human ciliary neurotrophic factor, interleukins-6, -2, -3 and -gamma, erythropoietin and leukocyte inhibitory factor, and in helix C of human interleukin-1-beta and oncostatin-M. Prosaponin (AAR70783) and saposin-C also promoted nerve cell myellnation ex vivo.

The invention is useful for preventing the death of cells e.g. brain cells, neurons and cardiac muscle cells, in vitro or ex vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of prosaposin-related peptides or derivatives as cytoprotective agents, for suppressing apoptosis or apoptosis-like cell death
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                       The present sequence represents a prosaposin-derived peptide. A method has been developed of alleviating or preventing neuropathic pain in a subject, comprising administering an effective amount of an active fragment of prosaposin to the subject. The prosaposin-derived peptide is useful for therapy of neural or demyelination disorders in neural tissue. It can be used to stimulate neurite outgrowth, inhibit neural cell death, promote myelination or inhibit demyelination. The method is used to alleviate neuropathic pain resulting from a peripheral nerve disorder, such as neuroma, nerve compression, crush or stretch and incomplete nerve transsection, mononeuropathy crush or stretch and Alternatively the neuropathic pain results from a disorder of the dorsal root ganglia, spinal cord, brainstem, thalamus or cortex.

The invention relates to prosaposin receptor agonists. Also claimed are: (1) methods for alleviating neuropathic pain or inhibiting the conset of neuropathic pain, comprising administering a prosaposin receptor agonist; (2) inhibiting sensory or motor neuropathy, comprising receptor agonist; (3) methods for stimulating neurite outgrowth, inhibiting neural cell death, promoting mevelination, or inhibiting comprising ontacting neuronal cells with a composition, or inhibiting demyelination comprising a prosaposin receptor agonist which has 14-50 amino acids and comprises the sequence of a propasposin derived protein. The processes may be used for treatment of neuropathic pain resulting from peripheral nerve disorders (e.g. neuroma, nerve compression, nerve crush, nerve stretch, incomplete nerve transsection, mononeuropathy or polyneuropathy or disorders of dorsal root ganglia, the spinal cord, the brainstem, the the ortex. The present agonists do not cause undesirable prosaposin receptor agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Huntington's disease; ischemic heart disease; Guillain-Barre disease; alopecia; AIDS dementia; cerebral malaria; HTLV; neuropathy; inflammatory neurodegenerative disease; toxin-induced liver disease.

                                                                                                                                                                                                                                                                                                                                                                                    Prosaposin is a 70kDa glycoprotein which is proteclytically processed to generate saposins A, B, C and D, all of which are similar to each other and have a similar placement of six cysteines, a glycosylation after and have a similar placement of six cysteines, a glycosylation of the and conserved proline residues. Prosaposin, saposin C and prosaposin derived peptides (prosaptides), have therapeutic applications in promoting recovery after toxic, traumatic, myocardial ishchaemic, degenerative and inherited lesions to the peripheral and central nervous system. Prosaposin receptor agonists (PRAs) inhibit proinflammatory cytokine-induced apoptosis by activation of the Ser/Thr protein kinase Akt. Akt dissociates complexes of Bcl-2 family members, such as BAD-Bi-2, releasing Bcl-2 and its family members which inhibit caspases, thereby inhibiting apoptosis. An additional mechanism whereby PRAs inhibit apoptosis is by blocking activation of JNK, a proapoptofic signaling component. Within activation of JNK, by Three alpha is another well known mechanism for activation of JNK by Thr alpha is another well known mechanism for TNF alpha-induced by tumor necrosis factor-alpha (TNF alpha). The cappates associated or induced by a proinflammatory cytokine-induced apoptosis. The method can be used for inhibiting apoptosis which is caspase-mediated or induced by a proinflammatory cytokine-induced arthritis. Crohn's disease, irritable bowel syndrome, asthma, cardiac arthritis, action, concestive heart silvine, multiple sclerosis, acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           amyotrophic lateral sclerosis, Huntington's disease, ischemic heart disease, Guillain-Barre disease, traumatic brain injury, traumatic spinal cord injury, alopecia, AIDS dementia, cerebral malaria, HTLV, neuropathy, inflammatory nacodegenerative disease, and toxin-induced liver disease. This peptide corresponds to amino acids 8 to 29 of human saposin C (See AAM85653) and acts as a prosaposin receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to use of a prosaposin-related peptide or derivative, in the production of a medicament for use in preventing or delaying cell death, or in promoting the expression of cell death supporting gene product Bcl-XL. The invention is useful for preventing the death of cells e.g. brain cells, neurons and cardiac muscle cells, in vitro or ex vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                        Use of prosaposin-related peptides or derivatives as cytoprotective agents, for suppressing apoptosis or apoptosis-like cell death

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       by the sequential action of specific hydrolases. Some of these enzymes require specific low-molecular mass, non-enzymic proteins: the sphingolipids activator proteins (coproteins). FUNCTION: Saposin A and saposin C stimulate the hydrolysis of glucosylceramide by beta-glucosylceramidase (EC 3.2.1.45) and galactosylceramide by beta-galactosylceramidase (EC 3.2.1.46). Saposin C apparently acts by combining with the enzyme and acidic lipid to form an activated complex, rather than by solubilizing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cerebroside sulfate by arylsulfatase A (EC 3.1.6.8), GM1 apaginglishes by beta galactosidase (EC 3.2.1.23) and globotriacosylceramide by alpha galactosidase A (EC 3.2.1.22). Saposin B forms a solubilizing complex with the substrates of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hum. Mutat. 4:233-242(1994).

Namorita N.;
Saposin-C from bovine spleen; complete amino acid sequence and
relation between the structure and its biological activity.";
Blochim. Blophys. Acta 1120:75-80(1992).
I- FUNCTION: THE LYSOSOMAL DEFENDATION OF SPHINGOLIPIDS TAKES PLACE
STATE SEQUENTIAL ACTION OF SPECIFIC HYDROLASES. SOME OF THESE
ENZYMES REQUIRE SPECIFIC LOW-MOLECULAR MASS, NON-ENZYMIC PROFINS:
THE SPHINGOLIPIDS ACTIVATOR PROTEINS (COPROTEINS) (BY SIMILARITY).
C-1- FUNCTION: SAPOSIN A AND SAPOSIN C STIMULATE THE HYDROLYSIS OF
GLUCOSYLCERRAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.45) AND
CALACTOSYLCERAMIDE BY BETA-CALACTOSYLCERAMIDASE (EC 3.2.1.46).
CARACTOSYLCERAMIDE BY BETA-CALACTOSYLCERAMIDASE (EC 3.2.1.46).
CARACTOSYLCERAMIDE BY BETA-CALACTOSYLCERAMIDASE (EC 3.2.1.46).
CARACTOSYLCERAMIDE BY BETA-CALACTOSYLCERAMIDASE (EC 3.2.1.46).
CALACTOSYLCERAMIDE BY BETA-COMBINING WITH THE BIXZYME AND ACTIVATED COMPLEX, RATHER THAN BY SOLUBLIZING

Submitted (NOV-1998) to the EMBL/GenBank/DDBJ databases.

- FUNCTION: THE LYSOSOMAL DEGRADATION OF SHURGOLIPIDS TAKES PLACE
BY THE SEQUENTIAL ACTION OF SPECIFIC HOROLASES. SOME OF THESE
ENZYMES REQUIRE SPECIFIC LOW-MOLECULAR MASS, NON-ENZYMIC PROTEINS:
THE SPHINGOLIPIDS ACTIVATOR PROTEINS (COFFOTEINS) (BY SIMILARITY).

- IF SPHINGOLIPIDS ACTIVATOR PROTEINS (COFFOTEINS) (BY SIMILARITY).

- IF GLUCOSYLCERAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.45) AND
GALACTOSYLCERAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.46).

SAPOSIN-C APPARENTLY ACTS BY COMBINING WITH THE ENZYME AND ACIDIC
LIPID TO FORM AN ACTIVATED COMPLEX, RATHER THAN BY SOLUBILIZING
THE SUBSTRATE (BY SIMILARITY).
                                                                                 sequence.";

CEREBROSIDE SULFATE BY ARYLSULFATASE A (EC 3.1.6.8), GM1
CANGLIOSIDES BY BETA-GALACTOSIDASE (EC 3.2.1.23) AND
GLOBOTRIAOSYLCERAMIDE BY ALPHA-GALACTOSIDASE A (EC 3.2.1.22).
SAPOSIN'B FORMS, A SOLUBILIZING COMPLEX WITH THE SUBSTRATES OF THE
SPHINOCLIPID HYDROLASES (BY SIMILARITY).

C -1- FUNCTION: SAPOSIN D IS A SPECIFIC SPHINGOMELIN PHOSPHODIESTERASE
ACTIVATOR (EC 3.1.4.12) (BY SIMILARITY).

C -1- SUBGUIT: SAPOSIN D IS A HOMODIMER (BY SIMILARITY).

C -1- SUBCLILIAR LOCATION: LYSOSOMEL (BY SIMILARITY).

C -1- PUNCTIONS SAPOSIN B SAPOSIN PROCESSED TO 4 SMALL
PEPTIDES, WHICH ARE SIMILAR TO EACH OTHER AND ARE SPHINGOLIPID
HYDROLASE ACTIVATOR PROTEINS (BY SIMILARITY).

C -1- SIMILARITY: CONTAINS 2 SAPOSIN A-TYPE DOMAINS.

C -1- SIMILARITY: CONTAINS 4 SAPOSIN B-TYPE DOMAINS.

Centromere/microtubule binding protein CBF5 (Centromere-binding factor
5) (Nucleolar protein CBF5) (P64').
CBF5 OR YLR175W OR L9470.11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nature 387:87-90(1997).

-1- FUNCTION: BINDS IN VITRO TO CENTROMERES AND MICROTUBULES. IT IS A CENTROMERE DNA-CEPT3-BINDING FACTOR AND IS INVOLVED IN MITOTIC CHROMOSOME SEGREGATION. IT IS SESENTIAL FOR CELL GROWTH. MAY BE IN SOME WAY ASSOCIATED WITH THE CBF3 110 KDa SUBUNIT (CBF3A).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -1- SUBCELLULAR LOCATION: Nuclear; nucleolar.

Patent No. 5714459
GENERAL INFORMATION:
APPLICANT: O'Brien, John S.
APPLICANT: KISHIMOTO, YASUO
TITLE OF INVENTION: USE OF PROSAPOSIN AND NEUROTROPHIC PEPTIDES
TITLE OF INVENTION: DERIVED THEREFROM
NUMBER OF SEQUENCES: 11
CORRESPONDENCE ADDRESS:
ADDRESSEE: Knobbe, Martens, Olson and Bear
STREET: 620 Newport Center Drive, Sixteenth Floor
GENERAL INFORMATION:
APPLICANT: O'Brien, John S.
TILLE OF INVEWION: Prosaposin and Cytokine-Derived Peptides
TITLE OF INVEWION: as Therapeutic Agents
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
ADDRESSEE: Campbell & Flores LLP
